

Course: Industrial Security for Beginners

Enhance your competencies and invest in your future

The cyber threats and attacks on critical infrastructure and industrial (OT) environments are growing in parallel with the shortage of skills required to understand and respond to them. However, the solution may already exist within your own organization.

Employees serve as the best defense. Therefore, it is crucial to broaden their understanding of security and equip them with practical skills to effectively safeguard your company.

This course is designed to educate, empower, and develop key employees in the production environment, aiming to reduce risks within your company.

Participants will gain the knowledge to understand OT security, increase their security awareness, and strengthen your company's defenses against cyber threats and attacks.

The course provides:

An introduction to what cybersecurity means in industrial OT systems.

Fundamental knowledge of OT security hygiene.

An overview of cyber-attack characteristics in OT systems.

Access to the ICS Range training platform, with opportunities to work on real-life exercises.

Interactive sessions with leading OT security experts.

Participants will receive:

Knowledge of attack characteristics and tools to identify and detect cyberattacks on OT equipment.

Insights into typical vulnerabilities within companies and into hackers' mindsets.

Practical tools for further developing OT security within their own organizations.

One month of free access to the ICS Range training platform.
